"Compared with nonusers, the relative telomere length of leukocyte DNA was on average 5.1% longer among daily multivitamin users. In the analysis of micronutrients, higher intakes of vitamins C and E from foods were each associated with longer telomeres, even after adjustment for multivitamin use."

Using TA on the Rings of Fire, Earth and Crystal led to rejuvenation of telomeres averaging 3.5% in one year, instead of the expected 1% usual shrinkage each year. Stimulating these 3 acupuncture circuits optimizes DHEA and calcitonin and lowers free radicals, while also rejuvenating telomeres.

Telomerase activation and telomere length regulation. Telomere length in telomerase-positive tissues is determined by a number of variables, among which are the absolute telomerase levels, the frequency of telomerase-telomere interactions, and the number of telomeric repeats added to each telomere upon recruitment.

The other 99% are incapable of doing so. What about neurons, and heart cells that typically do not divide and where their telomeres do not shorten with age? The large majority of liver and kidney cells can't lengthen telomeres, etc., etc. Perhaps the 1% that can are the most critical. They include white blood cells (WBCs) and many stem cells.

What if everything you think you know about getting older and staying healthy is ... wrong? In The Telomere Miracle, Dr. Ed Park explores the revolutionary idea that disease and aging in humans all arises from one single source: genetic errors caused by shortening of telomeres, or the sequences of DNA at the ends of our chromosomes. Telomeres naturally shorten over time, and ultimately, as a ...

In this article, I examine the emerging body of nutritional science in the context of improving your telomeres, a key approach to true anti-aging. A telomere is a repeating sequence of DNA at the end of a chromosome. Each time a cell replicates and divides, the telomere loses some of its length.

Telomere length varies greatly between species, from approximately 300 base pairs in yeast to many kilobases in humans, and usually is composed of arrays of guanine-rich, six- to eight-base-pair-long repeats. Eukaryotic telomeres normally terminate with 3' single-stranded-DNA overhang, which is essential for telomere maintenance and capping.
