

### LINEAR CONTROL SYSTEM ANALYSIS AND DESIGN WITH MATLAB

A linear system is a mathematical model of a system based on the use of a linear operator. Linear systems typically exhibit features and properties that are much simpler than the nonlinear case. As a mathematical abstraction or idealization, linear systems find important applications in automatic control theory, signal processing, and telecommunications. For example, the propagation medium for wireless communication systems can often be modeled by linear systems.

CHAPTER 6 EARTHQUAKE RESPONSE OF LINEAR SYSTEMS One of the most important applications of theory of structural dynamics is in analyzing the response of structures to ground shaking caused by an earthquake. This chapter deals with linear systems, which are elastic systems, so we will refer to them by linearly elastic systems. Earthquake Excitation

As mentioned in Section 1.1, in the theory of linear systems it is common to allow impulse (generalized) functions in the kernel. For example, in (1) suppose  $h(t) = g(t) + g_0\delta_0(t)$ , where  $g(t)$  is a piecewise continuous function and  $\delta_0(t)$  is a unit impulse at  $t = 0$ .

These relations are important in the analysis of the system. In particular, we must have  $d > c$  to be in a physically realistic situation. ... So the theory of linear 2 2 systems gives us another way of looking at linear second order differential equations with constant coefficients.

A system can be defined as a set or arrangement of things related in such a way as to form a whole. Linear system analysis is concerned with the study of equilibrium and change in dynamical systems, that is, in systems that contain variables that may change with time.

Linear Systems Few physical elements display truly linear characteristics. For example the relation between force on a spring and displacement of the spring is always nonlinear to some degree. The relation between current through a resistor and voltage drop across it also deviates from a straight-line relation. However, if

Nonlinear system. Systems can be defined as nonlinear, regardless of whether known linear functions appear in the equations. In particular, a differential equation is linear if it is linear in terms of the unknown function and its derivatives, even if nonlinear in terms of the other variables appearing in it.
