Four lectures lead the reader from basic numerical methods for solving hyperbolic partial differential equations to the application of complex simulation codes to selected astrophysical problems. The text highlights the powerful capabilities, the use, and the pitfalls of computational astrophysics.

Computational astrophysics is most often studied through an applied mathematics or astrophysics programme at PhD level. Well-established areas of astrophysics employing computational methods include magnetohydrodynamics, astrophysical radiative transfer, stellar and galactic dynamics, and astrophysical fluid dynamics.

Computational astrophysics is the use of numerical methods to solve research problems in astrophysics on a computer. Numerical methods are used whenever the mathematical model describing an astrophysical system is too complex to solve analytically (with pencil and paper).

**Full text of "Computational methods for astrophysical ...**

Computational fluid dynamics, indeed all computation, is easy enough when there are no large or small parameters in the problem, but this is unfortunately rarely the case in astrophysics. Although...
