Abstract. Let (x, z) be a pair of observable random vectors. We construct a new "smoothed" empirical likelihood-based test for the hypothesis $E(g(z, \theta)|x) = 0$ w.p.1, where g is a vector of known functions and θ an unknown finite-dimensional parameter.

Given this view of data science, it is not at all surprising that the rise of data science has ended up blurring disciplines and attracting individuals with highly disparate backgrounds in the mathematical sciences (broadly defined). Many view this as a threat to statistics as a discipline.
