~~Comparison of orbital rocket engines—Wikipedia~~

The F-1 is a gas generator-cycle rocket engine developed in the United States by Rocketdyne in the late 1950s and used in the Saturn V rocket in the 1960s and early 1970s. Five F-1 engines were used in the S-IC first stage of each Saturn V, which served as the main launch vehicle of the Apollo program.

~~E, F & G (29mm) Engines—Estes Rockets~~

Part of the difficulty in designing an injector with dynamic stability was the sheer size of the F-1 rocket engine: The most powerful rocket engine at the time was the early revision of H-1, with its 165,000 pounds of thrust. The F-1 was to have 1,500,000 pounds of thrust.

Warning: This product can expose you to chemicals including crystalline silica, which is known to the State of California to cause cancer, and birth defects or other reproductive harm.

~~The F-1 Engine Powered Apollo Into History | NASA~~

The F-1 engine had roots outside NASA, born as an Air Force program developed by the aerospace firm Rocketdyne in 1955. NASA inherited it during a transfer of projects, conducted its own feasibility studies and awarded Rocketdyne a follow-on contract to step up work on the gargantuan propulsion system not long after NASA's formation, in 1960.

thrust rocket engine that NASA has ever flown (1.5 million pounds of thrust). The liquid-fueled engine was used during the Apollo program and sat at the bottom of the Saturn V. The engines were designed to be disposable. After reaching a certain altitude, the engines would shut down and fall back into the ocean.
