The MC68060 design is fully static so that when circuits are not in use, they do not draw power. Each unit can be disabled so that power is used only when the unit is enabled and executing an instruction. Complete code compatibility with the M68000 family allows the designer to draw on existing code and past experience to bring products to market quickly.

The particular type of microprocessor discussed is Motorola's 68000 family, including the most recent generation of 68000 chips. Clements' emphasis is practical, providing the necessary detail to enable students to design actual, working systems.

The 68000 also saw success in the field of industrial control systems. Among the systems benefited from having a 68000 or derivative as their microprocessor were families of programmable logic controllers (PLCs) manufactured by Allen-Bradley, Texas Instruments and subsequently, following the acquisition of that division of TI, by Siemens. Users of such systems do not accept product obsolescence at the same rate as domestic users, and it is entirely likely that despite having been installed ...

Motorola 68000 - Wikipedia

The Motorola 68000 series is a family of 32-bit CISC microprocessors. During the 1980s and early 1990s, they were popular in personal computers and workstations and were the primary competitors of Intel's x86 microprocessors. They were most well known as the processors powering the early Apple Macintosh, the Sharp X68000, the Commodore Amiga, the Sinclair QL, the Atari ST, the SNK NG AES/Neo Geo CD, the Sega Genesis, Atari Jaguar and Commodore CDTV.

The 6800 ("sixty-eight hundred") is an 8-bit microprocessor designed and first manufactured by Motorola in 1974. The MC6800 microprocessor was part of the M6800 Microcomputer System that also included serial and parallel interface ICs, RAM, ROM and other support chips. A significant design feature was that the M6800 family of ICs required only a single five-volt power supply at a time when ...
