The muscles in the pelvic area, such as the pelvic floor, urethral sphincters, bladder and anal sphincter muscles are controlled by the brain through nerves that run from the sacral area. Our sensations, such as fullness in the bladder or rectum, are also relayed to the brain via these nerve routes.

Though not first-line therapy, sacral nerve stimulation is indicated for those patients who have failed to see success from conservative treatment in the problems of voiding and storage. New Perspectives in Sacral Nerve Stimulation is the first comprehensive overview of this exciting, intriguing field.

["New Perspectives in Sacral Nerve Stimulation", by U Jonas...](#)

The sacral nerve is actually a group of five nerves emerging from the sacrum. There are two groups of these nerves. The sacrum is a large triangle-shaped bone located at the bottom of the spine and top of the pelvic cavity. This bone basically wedges itself between the hip bones.

The sacral nerves are the five pairs of spinal nerves which exit the sacrum at the lower end of the vertebral column. The roots of these nerves begin inside the vertebral column at the level of the L1 vertebra, where the cauda equina begins, and then descend into the sacrum. There are five paired sacral nerves,...

The sacral plexus is a region where several spinal nerves come together and then branch out to innervate most of your lower body. In this lesson, learn about the structure and function of the ...

[Chapter 4](#)

Electrical impulses are sent directly to the sacral nerves to improve or restore bladder or bowel function. Sacral nerves are in your lower back. They control anus, rectum, and bladder functioning. SNS is done when medicine and behavior therapy do not help improve symptoms. Implantation of an SNS includes 2 stages.
