A soft starter is a solid-state device that

protects AC electric motors from damage caused by sudden influxes of power by limiting the large initial inrush of current associated with motor startup. They provide a gentle ramp up to full speed and are used only at startup (and stop, if equipped).

A soft starter is any device which controls the acceleration of an electric motor by means of controlling the applied voltage. An Induction motor has the ability to self start owing to the interaction between the rotating magnetic field flux and the rotor winding flux, causing a high rotor current as

Soft starters will protect your electric motor from possible damage and at the same time extend the lifespan of your electric motor and the whole system by declining the heating caused by frequent start/stops ...

~~Soft Starters | Schneider Electric~~  
Motor starting matters. ABB's softstarters increase a motor's lifetime by protecting it from electrical stresses. They do so by letting you optimize starting currents that with conventional starting methods put lots of stress on the motor.

A soft starter relies on three pairs of SCRs (silicon controlled rectifiers) — one pair for each phase of power — that are applied gradually for portion of each voltage phase, limiting the voltage provided to the motor. In turn, current is

a "Soft Start" (as it relates to AC electric motors) is any device that will reduce the torque delivered to the power train. Mechanically, this can be a clutch, fluid drive, magnetic coupling, shot coupling or any one of a variety of devices that allow the motor to start-up Across-the-Line (X-Line or D.O.L.)...
