Richard C. Lewontin. 3.84 - Rating details - 237 ratings - 23 reviews One of our most brilliant evolutionary biologists, Richard Lewontin has also been a leading critic of those--scientists and non-scientists alike--who would misuse the science to which he has contributed so much.

The realm of immediate qualities contains everything of worth and significance. But it is uncertain, unstable and precarious. The first consideration induces us to prize consciousness supremely; the ...

Not in Our Genes, and The Triple Helix: Gene, Organism, and Environment, he has challenged molecular biologists and geneticists to think about the living world more holistically than is currently fashionable. Lewontin is well-known for

Rejecting the notion that genes determine the organism, which then adapts to the environment, he explains that organisms, influenced in their development by their circumstances, in turn create, modify, and choose the environment in which they live. The Triple Helix is vintage Lewontin: brilliant, eloquent, passionate, and deeply critical.

The Triple Helix: Gene, Organism, and Environment ...
Triple-stranded DNA (also known as H-DNA or Triplex-DNA) is a DNA structure in which three oligonucleotides wind around each other and form a triple helix. In triple-stranded DNA, the third strand binds to a B-form DNA (via Watson-Crick base-pairing) double helix by forming Hoogsteen base pairs or reversed Hoogsteen hydrogen bonds.

The Triple Helix -- Richard Lewontin | Harvard University Press
Richard Lewontin's "The Triple Helix" is a delightful literary composition in four movements consisting of three lectures and an essay on contemporary trends in biology and genetics. While the three in the triple helix metaphor refers to the interactive nature of a gene, an organism and an environment, it is also a reference to the notion that the human DNA (double helix) nucleotide-sequencing project is less than the be all and end all of genetics research.

From Richard Lewontin, The Triple Helix: Gene, Organism, and Environment(Harvard 2001) It is not possible to do the work of science without using a language that is filled with metaphors.

Figure 2.66 - Helix-Turn-Helix Domain of a Protein Bound to DNA Wikipedia. Helix-turn-helix is a common domain found in DNA binding proteins, consisting of two α -helices separated by a small number of amino acids. As seen in Figure 2.66, the helix parts of the structural domain interact with the bases in the major groove of DNA.

The Triple Helix stands back to look at the whole of biology as we practice it at the turn of the century. A key question remains in development and evolution: how to explain variation. Genes may...
